The main reasons to use the TreeParker® system

"The best solution for planting urban trees"

Strongest system: tested for the heaviest traffic loads
TreeParker system is tested In Germany because of the high standards in testing. The system is tested at the weakest point; single unit not connected, without soil. Both our highest 150 cm and smallest system 40 cm is being tested.

Flexible & easy to install: no delay, no extra costs
Only after excavation the underground situation is perfectly clear. Unforeseen obstacles (e.g. utilities etc.) can be in conflict with the tree pit design. NO PROBLEM with TreeParker®, the system can be adjusted in layout and height, preventing any delay and or costs.

Integrated water storage
By using irrigation water in the best way, water spills are limited and the tree will benefits the most of the water. Also rain water can help the tree to survive the harsh city conditions.

On site education and supervision
Complementary on site training. One of our technical consultants will be available during the preparation of the project and will also train your employees why and how to install the system. During the start of the TreeParker® installation we are also supervising the project and educate the foreman/ project manager in planning and supervising the project.
